SEO recovery plan: 12 months for a declining fintech blog

Qasim Khursheed · **Brief version:** 2026-07 · **Date:** 12 October 2026 · **Fixture SHA-256:** `fa691abc31b14093230657d17674ab0120449c54d20cef54bfe73686fe9b99c6` **Workbook:** `SEO_003_audit_and_refresh_model.xlsx`, start on the Start_Here sheet. **Labels:** [Observed] fixture, brief or live tool pull · [Estimated] my estimate · [Benchmarked] named source · [Assumed] placeholder. A label at the start of a paragraph covers every number in it unless a number carries its own.

The short version. Traffic fell because the pages that used to rank have not been updated in two to five years, the competitors above them have, and an AI Overview now sits on top of the big head terms. A third of the sample's lost traffic was two dated URLs that expired. The data points to page age and a changed results page rather than links or a penalty; the week-one link audit confirms or overturns that before the budget is spent. The plan: agree a conversion KPI with the VP, fix the seven highest-value pages in 30 days, run all 400 posts through one rule set, and earn relevant links to the pages that make money. [Estimated] Month 12 base case: about 117K visits and roughly double the organic conversions, inside a low-to-stretch range of 101K to 136K. 140K sits above the stretch case. Section 8 says why.

Map to the brief: diagnosis and competitive response are sections 1 to 4, content and technical 5 to 7, roadmap 8.

Written answer

1. Agree the KPI with the VP first

[Observed] The brief gives 85K and 140K visits with no source. If those are Ahrefs or Semrush numbers they are estimates built from rankings and an assumed click rate, blind to AI Overviews and seasonality. I report on GA4 sessions and Search Console clicks, and set goals on revenue rather than a tool estimate.

[Observed] Traffic and revenue point in different directions here. Of the 35,710 visits the sample lost, 16,460 (46%) were on six pages with zero conversions. Four pages produce 77.5% of the 200 conversions. The two comparison pages get 2,000 visits a month and 72 conversions, 12 per 1,000 visits, against 1.85 for the sample. Winning back the dated per diem page would add 7,500 visits and nothing to pipeline.

[Observed] The conversion numbers need a quality check too. The 44 on the Ramp comparison page could be Ramp customers browsing; the 12 on the template page may be downloads. Until the CRM shows which leads became opportunities, 50 conversions on one page can be worth less than 5 on another.

The KPI I propose: organic conversions that reach SQL, by landing page, with pipeline value, monthly. Traffic stays as a health metric, split branded and non-branded and by page type. Week one is data collection: [Observed] the full 16 months Search Console keeps (90 days hides seasonality and rankings that bounced back), GA4 conversions by landing page for both years, CRM stage by landing page, Ahrefs new and lost referring domains by month, last-modified dates for all 400 posts, and CrUX field data. The Data_To_Request sheet in `SEO_003_audit_and_refresh_model.xlsx` lists each with an owner.

2. Why the traffic dropped

[Observed] The fixture is 18 pages, down 49.7% against 39.3% for the site. They hold 42% of today's traffic, so this is the top of the site rather than a fair sample. I use it to rank the causes. Sizing them for the whole site needs the full export.

Cause [Observed]	Share of lost traffic	Pages	Fix
Dated URLs expired	35.0%	`per-diem-rates-2022`, `quarterly-tax-deadlines-2023`	Redirect to evergreen URLs, refresh yearly
Head terms lost to fresher pages and an AI Overview, plus one cannibal	46.2%	`what-is-expense-management`, `expense-management-guide`, `business-expense-categories`, `corporate-card-vs-credit-card`	Refresh, merge the cannibal
Off-topic pages outranked by aggregators	9.1%	`accounting-software-list`, `bookkeeping-basics`	Remove
Rules changed, page did not	6.2%	`mileage-reimbursement-guide`	Refresh
Lost clicks without losing rank (AI Overview, mixed intent)	2.2%	`receipt-scanning-app` (#5 then and now, traffic down 31%)	Refresh for citation, accept lower traffic
Comparison page slipping	2.2%	`vs-ramp` (6 to 11)	Rebuild first
Pages that grew	-3.8%	`travel-expense-policy`, `what-is-spend-management`, branded page	Build around them

Two kinds of drop. [Observed] The head terms slid 2 to 5 positions. That is competition. Four pages fell 17 to 38 positions (per diem 5 to 29, tax deadlines 3 to 41, accounting list 10 to 34, bookkeeping 14 to 31). That is expiry and off-topic content, and links do not fix it.

Old pages dropped, updated pages held. [Observed] The correlation between months since update and positions lost is 0.83, where 1.0 is a perfect match. Pages that fell were last updated 39 months ago on average; pages that held, 21. Nothing in the sample has been touched since January 2025, the 18-month audit gap in the brief. The two pages that improved are the two most recently updated.

Rankings explain the lost clicks. I applied a standard click-through curve ([Benchmarked] FirstPageSage via Backlinko for positions 1 to 10; page 2 and beyond [Assumed]) to each page's old traffic at its new position. On every head term the rank drop alone accounts for the lost clicks. Only the receipt scanning page lost clicks without moving, and the live SERP shows why.

Who took the positions. [Observed] Live US SERPs, 12 October 2026. An AI Overview sits above the first result on four of the five terms. "What is expense management": NetSuite (updated July 2025), Medius, Ramp (July 2026), Airwallex (May 2026), Stripe (July 2026); ours was last updated January 2024. "Business expense categories": IRS, NetSuite (September 2026), Ramp (May 2026), Paychex (March 2026); ours is from November 2023 with outdated IRS references. "Corporate card vs credit card": JPMorgan, Chase, Reddit, Amex, Investopedia; Ramp is not in the top 10. "Per diem rates": GSA, State, DoD, Commerce. "Receipt scanning app": an AI Overview, consumer cashback apps, a video carousel, Reddit. The fixture note blames a lost snippet to Ramp. That is half of it: everyone in the top five refreshed in 2025 or 2026 and the AI Overview took the top. [Benchmarked] Ahrefs measured a 58% lower click rate for the first result when an AI Overview is present (February 2026, 300,000 keywords), so #1 does not bring back 14,100 visits.

Links: what the data says, and what it cannot see. [Observed] Pages with more referring domains rank higher today (correlation -0.77 with position), but links did not protect pages from falling. The four pages with 50+ referring domains (84, 74, 61, 52) all dropped; the two that grew have 26 and 11. With page age held constant, link counts add nothing (partial correlation -0.07, against 0.80 for age with links held constant). The best-linked pages, the ones a bought-link story would hit hardest, slid the least: 2 to 5

places, while the pages that fell 17 to 38 places have 4 to 22 links. So "our pages lack links" is not what happened. What the fixture cannot see: link quality, links lost during the year, or competitors out-building us. Links Google quietly neutralized would look exactly like the slow slide the head terms show, so this file cannot separate that from "fresher competitors". Links are the second hypothesis and still open. In weeks one and two I run Ahrefs new and lost by month for the domain and the four fallen pages, check anchors and DR spread, read the manual actions report, and line it all up with the update calendar. A spike before the drop, exact-match anchors, a cluster of lost domains or a manual action means links come first: reclamation and PR move to the front, refreshes slow, head-term targets move out a quarter. A clean audit means the order below stands.

Google updates. [Benchmarked] In the 12 months to the brief date (Search Engine Journal): spam August 2025, core December 2025, core and spam March 2026, core May 2026, spam June 2026. The brief has no monthly trend, so I cannot line the drop up yet. The rule for the Search Console export: a step down inside a core update means content quality; inside a spam update, the link profile; a slow slide, decay and competition. [Observed] The fixture argues against a sitewide hit: 5 of 18 pages on the same template held or grew.

Ramp's footprint and link pace. [Observed] Ramp ranks for about 34,000 to 41,000 US keywords with 420,000 to 474,000 estimated monthly visits, roughly 3x our keywords and 5x our traffic, and even that softened between June and October 2026. Over the 12 months to September 2026 Ramp gained a net 340 referring domains a month, doubling in the second half. Brex gained 165. Our own pace goes into the Competitors sheet in week one.

Core Web Vitals. [Observed] LCP of 3.2s and failing mobile vitals are real, but the pages that held rank share the same slow template. Vitals are a tiebreaker: between two pages with similar authority and content the faster one tends to win, but they do not lift a page losing on freshness or authority. Content and links first, speed next. It still gets the first sprint because it is cheap and helps mobile conversion.

Data: `SEO_003_audit_and_refresh_model.xlsx`, sheets Why_Traffic_Dropped, Live_SERPs, Competitors.

3. Seven things in the data I would not take at face value

1. **The traffic numbers.** Source unknown, monthly, against conversions counted over 90 days.
2. **The notes column.** [Observed] "Highest converting blog page" on the corporate card page is wrong. The branded page under /blog has 52 conversions to its 31 and inflates every blog total. It comes out of the SEO baseline.
3. **Referring domain counts.** [Observed] The fraud statistics page has 74 and 1 conversion; the Ramp comparison page has 19 and 44. Quality and relevance decide, and the fixture has neither.
4. **Conversions without lead quality.** [Observed] 44 on the Ramp comparison and 12 on the template need CRM stages before they set priorities.
5. **The receipt scanning drop.** [Observed] Same position, 31% fewer clicks. A refresh aimed at rank cannot fix that.
6. **The spend management "win".** [Observed] 300 to 650 visits is too small to call a trend.
7. **The sample itself.** [Observed] 18 rows, 42% of site traffic, down 50% against the site's 39%. I would not scale these shares to the full site.

Data: the "Watch out" column in Page_Triage, `SEO_003_audit_and_refresh_model.xlsx`.

4. Ramp: fight, flank, concede

[Observed] Ramp published 50 posts in six months, about 100 a year at that pace [Estimated], against our 48, and gains 340 referring domains a month. We do not out-publish them.

[Observed] **Fight** where we convert or already hold: the comparison and alternatives pages (12 conversions per 1,000 visits), the corporate card decision content (hold #5 against the banks and convert; do not chase #1 against JPMorgan), and the expense management head terms on depth and freshness, with the definition written so the AI Overview can cite it. **Flank** with formats Ramp's volume does not cover: templates and tools (expense policy, categories sheet, report template, mileage calculator; the categories SERP shows PDF and spreadsheet demand), original data from anonymized product spend (the fraud page already has 74 referring domains), and the spend management cluster where we are growing on our own. **Concede** generic finance education (invoicing, bookkeeping, accounting software lists), the per diem and tax deadline rate queries that government sites own, and consumer SERPs like receipt scanning. Keep a cheap evergreen page for the long tail and spend nothing else.

Data: Topics sheet, `SEO_003_audit_and_refresh_model.xlsx`.

5. The 400 posts: four decisions, eight rules

Every page gets one of four decisions: Protect, Refresh, Consolidate or Kill. The rules run in order; the first that fits wins.

- R1 Two pages targeting one keyword → Consolidate the weaker into the stronger.
- R2 Year in the URL → Consolidate into an evergreen URL, refresh on a calendar.
- R3 Off-topic, zero conversions, under 10 referring domains, lost 15+ positions ([Assumed] thresholds, editable) → Kill.
- R4 Two or more conversions per 1,000 visits, or branded → Protect: light update, stronger CTA, links pointed in.
- R5 Holding or gaining, updated in the last 24 months → Protect and build around it.
- R6 Traffic with no product relevance → Protect, spend nothing, test one CTA.
- R7 Lost rank, or older than 18 months on a core topic → Refresh, same URL. Pages with 70+ referring domains are never redirected.
- R8 Anything else → monitor.

[Observed] On the fixture: 8 Protect, 5 Refresh, 3 Consolidate, 2 Kill. Priority is traffic lost times conversion relevance, conversion pages first, with the free fixes (redirects, removals) in the same month. Refresh beats new wherever a URL already has links and a ranking history; an 84-referring-domain page at #4 beats a new post every time. New posts go only where a converting topic has no URL: the comparison hub and the spend management cluster.

Priority	Page	Decision	What we do
P1	`/compare/vs-ramp`	Protect	Rebuild as a real comparison with a pricing and feature table, stronger CTA, internal links from the two strongest blog pages [Observed]
P1	`/blog/what-is-expense-management`	Refresh	Full refresh for depth and AI Overview citation; redirect `/blog/expense-management-guide` into it
P1	`/blog/per-diem-rates-2022`, `/blog/quarterly-tax-deadlines-2023`	Consolidate	Redirect to evergreen URLs, refresh yearly, no other spend
P1	`/blog/bookkeeping-basics`, `/blog/accounting-software-list`	Kill	Remove, or redirect to a hub if the few links are from real sites

P2	`/blog/business-expense-categories`	Refresh	Current IRS references plus a downloadable categories sheet
P2	`/blog/corporate-card-vs-credit-card`, `/blog/expense-report-template`	Protect	Light update, CTA, download-to-signup test; agree what counts as a conversion
P2	`/blog/mileage-reimbursement-guide`	Refresh	Current IRS rate in a block that can be quoted
P3	`/blog/receipt-scanning-app`, `/blog/expense-fraud-statistics`	Refresh	Write for citation; refresh the statistics yearly; never redirect the fraud page
P3	`/compare/vs-brex`, `/blog/travel-expense-policy`, `/blog/what-is-spend-management`	Protect	Build the clusters around them
P3	`/blog/company-name-expense-software`, `/blog/what-is-an-invoice`	Protect	Report the branded page separately; no spend on the invoice page

Scaling to 400. Export URL, target keyword, position now and 12 months ago, Search Console clicks, referring domains, last-modified date and GA4 conversions. The sheet works out the rest. Apply R1 to R8. A person reviews every Kill and Consolidate before a redirect goes live. Redirects ship in the sprint, refreshes through the freelancers, and refreshed pages are measured against a holdout. Every refresh brief runs through Clearscope against the current top 10 for its term, so the writers hit the depth the results page now demands rather than the depth it demanded in 2023. Capacity for the year: 48 new posts ([Observed] the brief's 4 a month), 96 refreshes ([Assumed] 8 a month) and about 80 consolidations or removals ([Estimated] SEO Specialist time). Every post gets a decision; about half get work.

Topics and page types. [Observed] By topic, comparison pages convert at 12 per 1,000 visits, corporate cards 2.5, the seven core expense management pages 0.68, rates and deadlines 0.61, off-topic finance 0. The topical map still matters, since the core cluster holds 246 of the sample's referring domains, but new content and links go to the converting topics first, and the final order waits for CRM pipeline by landing page. Product pages are 15% of traffic and comparison pages 10%, with no conversion data in the brief. I assume they convert best and treat the blog as the feeder: internal links from the strongest blog pages into the comparison hub and product pages, commercial queries moved onto product pages, templates and tools as the download-to-signup path.

Data: Page_Triage, Triage_Rules and Topics sheets, `SEO_003_audit_and_refresh_model.xlsx`.

6. Technical: one sprint a quarter

Sprint 1: blog template speed (hero image, fonts, lazy loading, caching), the redirect map, a related-posts and in-content link module. Sprint 2: comparison page template with tables, schema and CTAs, plus the template download flow. Sprint 3: internal linking automation built as a reverse silo, where guides link up to their topic hub, hubs link to the comparison and product pages, and every link is reciprocated so no page is orphaned. Sprint 4: held for what the data says. Cut: INP work, redesign, any framework change. Most speed work on WordPress is contractor work (images, caching, hosting), so the sprint buys template changes only.

7. Links on $15K a month

No paid links, no link networks, no directories; they are the one thing in this plan that could trigger the spam-update case in section 2. Every link we pursue passes three tests: the site is in our industry or next to it (finance, accounting, B2B software, business operations), it has real readers, and the link sits in the body of a relevant article. Four sources:

- **Contextual links to the blog guides from relevant domains.** [Assumed] $1,500 a month on outreach to accounting and finance publications (Accounting Today, CPA Practice Advisor, CFO Dive, Spend Matters as the kind of target), SaaS partners and integration directories, industry newsletters and expert roundups, each placement pointing at a refreshed guide or a comparison page with a natural anchor. Target 6 to 10 placements a month, qualified one by one.
- **Assets on our site that earn links on their own.** The templates and tools (expense policy, categories sheet, report template, mileage calculator), a yearly refreshed statistics page ([Observed] the fraud page already has 74 referring domains) and a benchmarks report. These give outreach something worth linking to and keep earning after the campaign ends.
- **Digital PR.** [Assumed] $2,500 a month for one original data study a quarter from anonymized, aggregated product spend data, pitched to finance and business press.
- **Reclaim and redistribute.** Unlinked brand mentions, broken links to the dated URLs, redirects so the [Observed] 22 and 9 referring domains on the expired pages pass to the evergreen ones, and internal links from the two strongest blog pages into the comparison hub.

Links go to the pages that convert or hold the head terms, never to volume.

Data: Competitors sheet, `SEO_003_audit_and_refresh_model.xlsx`; referring domain counts in `evidence/triage_table.csv`.

8. The 12-month plan, budget and targets

Budget and team. [Assumed] unless marked: tools $1,000; 4 new posts $1,200 [Observed]; 8 refreshes $1,600; digital PR $2,500; contextual link outreach $1,500; WordPress speed contractor $2,500 (front-loaded, drops by Q3); CRO and design $1,500; automation $700; reserve $2,500 (the Q3 data study production and any fix that cannot wait for a sprint); total $15,000. The SEO Specialist owns the triage sheet, Search Console monitoring, internal linking and sprint tickets. The Content Manager owns refresh briefs, freelancer QA, CTAs and templates. Three freelancers carry 4 new posts and 8 refreshes a month. No hire for six months; at month seven, a content strategist or editor only if refresh throughput is the bottleneck.

When	What ships	Sprint	Target [Estimated]
Days 1 to 30	KPI agreed and baselined; Search Console trend on the update calendar; link audit; all P1 pages live; holdout set ([Assumed] 20 refreshed vs 20 untouched)	Sprint 1 scoped	Redirects and removals live; Ramp comparison rebuilt
Days 31 to 90	P2 pages; 4 new posts a month in the spend management cluster; first data study scoped	Sprint 1 ships	The 90-day targets below
Q2	Rules run on all 400; data study #1; contextual link placements running; comparison hub (two more comparisons, one alternatives page); template library	Sprint 2	100+ posts actioned; conversions +40% to +60% on the Q1 baseline; traffic 100K to 110K
Q3	Refresh pipeline at full pace; data study #2; hiring decision	Sprint 3	250+ posts actioned; conversions about +80%; traffic 110K to 120K
Q4	All 400 actioned; yearly refresh calendar; holdout results reported	Sprint 4 (reserve)	Base case: conversions about 2x, traffic about 117K (low 101K, stretch 136K)

90 days. [Estimated] The Ramp comparison back in the top 8; the two head terms up 2 positions; refreshed pages beating the holdout on impressions; comparison page conversion rate up 25%; blog LCP under 2.5s in lab ([Benchmarked] Google's threshold). **6 months:** 100+ posts actioned, conversions up 40% to 60%, traffic 100K to 110K. **12 months, base case:** conversions about 2x,

traffic about 117K. Low case 101K and 1.5x; stretch 136K and 3x.

Why not 140K, and one caveat. [Estimated] The head terms sit under an AI Overview and the two expired URLs are government-owned queries, so even the stretch case lands under 140K; anything beyond the base case comes from new clusters and templates. The caveat: the model applies the sample's 46% head-term share of loss to the site's 55K loss, the scaling section 2 warns against. [Assumed] It is a scenario input only, bracketed by the low and stretch cases, until week-one Search Console data replaces it. Every assumption in Targets_Month_12 is an editable cell, and the Q1 holdout replaces the assumed refresh lift with a measured one.

If the 90-day numbers do not move. Head terms flat after 8 weeks indexed ([Assumed] window): the problem is format and authority, so Q2 refresh money moves to the data study and page formats change to tools and templates. Refreshed pages not beating the holdout: stop at 24 refreshes and go back to Search Console and the update calendar. The rebuilt comparison page not converting: the offer is the problem; product marketing owns it, SEO stays on traffic.

Also worth setting up. [Observed] Track who the AI Overview cites on the head terms (today NetSuite, Procurify, Workday, Airwallex and Ramp; we are absent). Compare year on year, since the tax deadline page is seasonal. Track mobile rankings separately, since mobile vitals are failing. Define a conversion in writing before the first report. Run a monthly check: which pages lost, which gained, what changed on theirs, what changed on ours. Happy to walk through the sheet live and run the rules on a messy sample of real posts.

Data: Plan_90_Days, Roadmap_12_Months, Budget and Targets_Month_12 sheets, `SEO_003_audit_and_refresh_model.xlsx`.

Operating artifact

`SEO_003_audit_and_refresh_model.xlsx`, 13 sheets. Start_Here gives the reading order and color legend. Working sheets: Why_Traffic_Dropped, Page_Triage, Triage_Rules, Topics, Plan_90_Days, Roadmap_12_Months, Budget, Targets_Month_12. Evidence sheets: Data_To_Request, Live_SERPs, Competitors, Ref_CTR_Curve. Page_Triage holds the [Observed] 18 fixture pages with decision, rule, priority, action and watch-out, derived numbers as live formulas. `scripts/analyze_fixture.py` reproduces every fixture number; `scripts/build_workbook.py` rebuilds the file.

Evidence log

Claim	Proof	Tier
Decline breakdown, correlations, page decisions	`scripts/analyze_fixture.py` on the fixture; outputs in `evidence/analysis_output.json` and `evidence/triage_table.csv`; workbook recalculates from inputs [Observed]	Tier 3
Who ranks now, AI Overview presence, competitor update dates	`evidence/live_serp_observations_2026-10-12.csv`, DataForSEO task ids included	Tier 3
Ramp footprint, Ramp and Brex link pace	`evidence/ramp_com_historical_rank_overview_2026-10-12.csv`, `evidence/competitor_link_velocity_2026-10-12.csv`, task ids included	Tier 3
Click-through curve, AI Overview click impact, update dates	backlinko.com/google-ctr-stats; ahrefs.com/blog/ai-overviews-reduce-clicks-update; searchenginejournal.com/google-algorithm-history	Tier 3 (named sources)
The audit and refresh model	`SEO_003_audit_and_refresh_model.xlsx`	Tier 2
Budget, roadmap, month-12 scenarios	Labeled assumptions in the workbook; the scaled head-term input is marked as a scenario assumption	Tier 0

Number source labels

Every paragraph with numbers opens with [Observed], [Estimated], [Benchmarked] or [Assumed]; a number from a different source carries its own label. Workbook cells carry the same labels in an adjacent column. Numbers in the page table are [Observed] from the fixture, `evidence/content_audit_sample.csv`.

AI usage disclosure

Tools: Claude (Anthropic) in Claude Code with the DataForSEO connector. What AI did: read the fixture and wrote the analysis script, computed the decline breakdown and correlations, pulled the live SERPs and the Ramp and Brex data, built the workbook, and drafted this document from my framing and corrections, in my voice. What I decided: conversions as the KPI, the order of the diagnosis, the eight rules and thresholds, each page's decision and priority, where to fight Ramp, the budget split, and not promising 140K. What I checked: every fixture number in the workbook against `evidence/content_audit_sample.csv`, the correlations against the script output, the SERP results against my own searches, and the workbook recalculation ([Observed] all formulas, zero errors). Known weak spots: the click curve past position 10 is assumed, a correlation on 18 rows shows direction rather than precision, and the month-12 base case rests on a scaled sample until the holdout and Search Console data replace its inputs.

What breaks it (failure handling)

Traffic numbers turn out to be tool estimates and Search Console shows a different shape: re-run the diagnosis on Search Console in week one before anything ships. A step down inside a spam update window: the link audit goes ahead of the refreshes and a targeted disavow is considered. No last-modified dates in the export: Wayback Machine for the top 100 ([Assumed] cut-off), publish date for the rest. Conversions cannot be tied to landing pages: fix GA4 and the CRM first, no page-level KPI until then. Refreshed pages do not beat the holdout: stop at 24 and go back to the data. The sprint slips: redirects go live through a plugin, speed work stays with the contractor, the comparison template waits. Lead quality shows the Ramp comparison conversions are Ramp customers: the page keeps its SEO priority and loses its conversion weight. Detection is the weekly check of the five indicators in Roadmap_12_Months.

What stays human

Agreeing the KPI with the VP and telling leadership that 140K [Observed] is the wrong number (Targets_Month_12 in `SEO_003_audit_and_refresh_model.xlsx` shows why). Every Kill and Consolidate before a redirect goes live. Any disavow. Which Ramp battles to fight. Publishing anything built on customer spend data (legal and privacy sign-off). Hiring. Reading the holdout and deciding whether the refresh program continues. AI drafts, scores and monitors. It does not decide what gets removed or what we promise.

Artifact access

Everything is in the submission folder, no login needed. [Observed] Files: `SEO_003_audit_and_refresh_model.xlsx` (Excel or LibreOffice, yellow cells are inputs); the fixture `evidence/content_audit_sample.csv` (checksum above); the outputs and pulls listed in the evidence log; `scripts/analyze_fixture.py` and `scripts/build_workbook.py`. To reproduce: `python3 -I`

`scripts/analyze_fixture.py evidence/content_audit_sample.csv evidence/` then `python3 -I scripts/build_workbook.py evidence/out.xlsx` (needs scipy and openpyxl). DataForSEO task ids can be re-checked in any DataForSEO account.
